193 Bottle Dual Zone Wine Cabinet Getting Started...

The Controls

Before First Use

Before turning on your wine cabinet for the first time:

- The wine cabinet must be rested for at least 6 hours in its location, before connecting to power and switching on.
- Clean the inner chamber and leave the door open during this 6-hour resting period to allow any residual odours to clear.
- Do not connect wine cabinet to electronic energy saving plug or converter that can convert DC into AC.
- When your wine cabinet is powered on initially, the LED display will light up all elements for 3 seconds and an audible start-up tone will sound. After 3 seconds, the display will be enabled for normal operation.

Energy Saving Tips

The appliance should be placed in the coolest area of the room, away from heat producing appliances or heating ducts. A suitable insulation board shall be applied if necessary.

Please avoid placement in direct sunlight.

Try to shorten opening time of cabinet's door. Regular opening of your wine cabinet door may lead to condensation on the glass door, particularly if the external air is humid. This is completely normal with all wine cabinets.

For more detailed operation, installation and product information refer to your User Manual.
